# Consideration of Internal and External Validity in Mechanistic Studies

Andrew Rooney, PhD

Strategies and Tools for Conducting Systematic Reviews of Mechanistic Data to Support  
Chemical Assessments

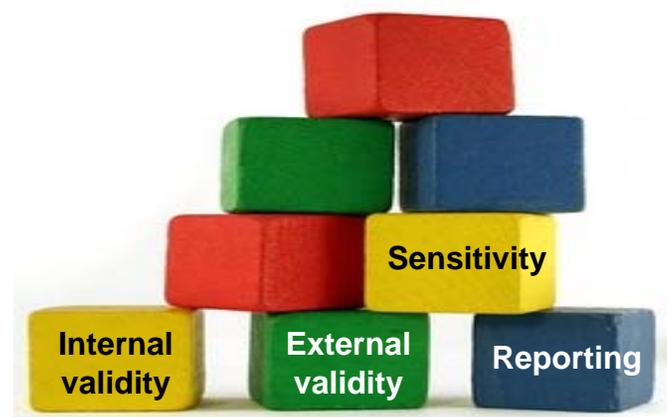

*December 10, 2018*

## Defining the Terms

- **Internal Validity**
  - Whether study design and conduct may bias results
  - Also called risk of bias
- **External Validity**
  - Extent study address the review question
  - Also called applicability, relevance
- **Reporting Quality**
  - Adequacy of reporting for evaluating study design, conduct, results
- **Sensitivity**
  - Whether study design and conduct impact ability to detect an effect

### Diverse Study Types, Model Systems, Designs

- Where does it come from?
  - Wide variety of study types not intended to identify a disease phenotype
  - Studies directed at mechanisms (cellular, biochemical and molecular)
  - Includes in vitro and in vivo studies
- Assessing quality or risk of bias
  - Mechanistic studies with in vivo exposure could be addressed by tools for human and animal studies
  - What about studies with in vitro exposure regimes?

### Shifting Focus to Mechanistic Studies

- Tools to Evaluate Human Studies
  - Established tools for randomized controlled trials
  - Active area of research for observational human studies (ROBINS-E., etc)
- Tools to Evaluate Animal Studies
  - Multiple tools (SYRCLE, Navigation Guide, OHAT)
- Tools and Emerging Approaches for Mechanistic Studies
  - Recent activity
    - Some tools (NTP/OHAT “use-case”, SciRAP)
    - What’s currently being done?
    - Need for a systematic review...

## OHAT Risk of Bias “Use-case” in PFOA Evaluation

### OHAT “Parallel” Approach Across Evidence Streams

- Features of OHAT risk-of-bias tool for assessing Internal Validity
  - Study design determines which questions are applicable
  - Evaluation is endpoint specific
- Predefined set of questions address
  - Human studies
  - Animal toxicology studies

Human Data

Experimental Animal Data

1. Randomization of exposure  
(experimental animal studies)

- Study design determines which questions apply

**Risk-of-Bias Questions**

|  | Experimental Animal | Human Controlled Exposure | Cohort | Case-Control | Cross-Sectional | Case Series |
|--|---------------------|---------------------------|--------|--------------|-----------------|-------------|
| 1. Was administered dose or exposure level adequately randomized?                          | X                   | X                         |        |              |                 |             |
| 2. Was allocation to study groups adequately concealed?                                    | X                   | X                         |        |              |                 |             |
| 3. Did selection of study participants result in the appropriate comparison groups?        |                     |                           | X      | X            | X               |             |
| 4. Did study design or analysis account for important confounding and modifying variables? |                     |                           | X      | X            | X               | X           |
| 5. Were experimental conditions identical across study groups?                             | X                   |                           |        |              |                 |             |
| 6. Were research personnel blinded to the study group during the study?                    |                     | X                         |        |              |                 |             |
| 7. Were outcome data complete without attrition or exclusion from analysis?                | X                   | X                         | X      | X            | X               |             |
| 8. Can we be confident in the exposure characterization?                                   | X                   | X                         | X      | X            | X               | X           |
| 9. Can we be confident in the outcome assessment (including blinding of assessors)?        | X                   | X                         | X      | X            | X               | X           |
| 10. Were all measured outcomes reported?   | X                   | X                         | X      | X            | X               | X           |
| 11. Were there no other potential threats to internal validity                             | X                   | X                         | X      | X            | X               | X           |

4. Confounding  
(observational studies)

## OHAT “Use-case” in PFOA/PFOS Evaluation

### A “Parallel” Approach Across Evidence Streams

- Predefined set of questions address
  - Human studies
  - Animal toxicology studies
- Features of OHAT risk-of-bias tool
  - Study design determines which questions are applicable
  - Evaluation is endpoint specific

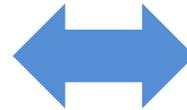

Use-case Explored  
Extending the Risk  
of Bias Approach  
from Experimental  
Animal Studies to  
Studies with an In  
Vitro Exposure  
Regime

Human Data

Experimental Animal Data

In Vitro Exposure Studies

## Use-Case Methods Development Process

### Extending the OHAT Risk-of-Bias Approach to In Vitro Studies

- Criteria adapted to address studies with in vitro exposure regimens
  - Multiple rounds of review and discussion with an NTP expert group addressed issues such as:
    - Applicability of questions
    - Where specific issues should be covered
    - Other issues not in the animal tool
    - Language for criteria
  - Applied to studies with an in vitro exposure regime

#### ***In Vitro* Review Group**

- Scott Auerbach
  - Warren Casey
  - Michael Devito
  - Stephen Ferguson
  - Rick Paules
  - Ray Tice
  - Kristine Witt
- Contractors
- David Allen
  - Michael Paris
  - Judy Strickland

# Use-Case Adaptation Example

## 1) Was administered dose or exposure level adequately randomized?

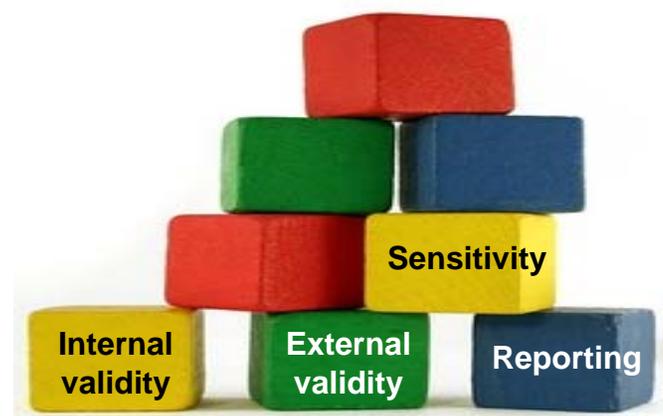

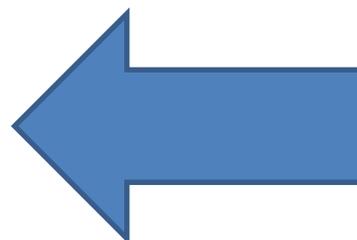

- Helps to assure that treatment is not given selectively based on potential differences in human subjects, animals, **cells, or tissues**
- Requires each human subject, animal, **or cell** had an equal chance of being assigned to any study group including controls
- In vitro study applicability
  - Potential differences between cells that comprise different groups will depend on study design
  - If homogeneous cell suspension, then no variation or difference between groups ... therefore, no need for randomization
  - Used in NTP Monograph: Immunotoxicity Associated with Exposure to PFOA/PFOS (<http://ntp.niehs.nih.gov/go/749926> )

## ... Remember Other Study Quality Factors

- **Internal Validity**
  - Whether study design and conduct may bias results
  - Also called risk of bias
- **External Validity**
  - Extent study address the review question
  - Also called applicability, relevance
- **Sensitivity**
  - Whether study design and conduct impact ability to detect an effect

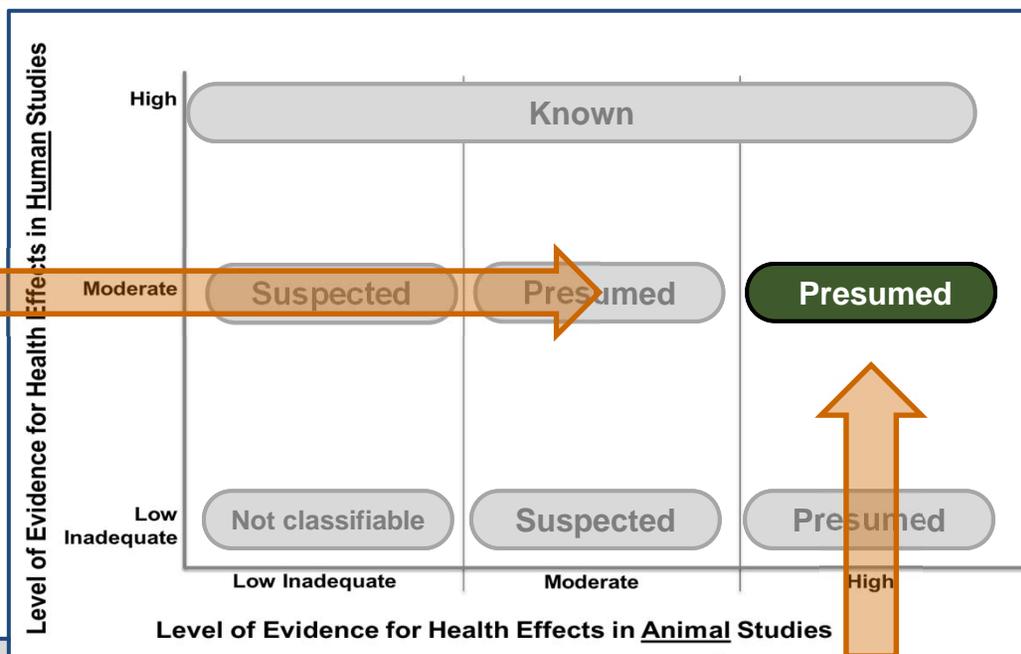

## Consider How Mechanistic Data Are Used in the Evaluation

Human Evidence

### Mechanistic Data Informed Conclusions in Evidence Integration Step in PFOA/PFOS Immunotoxicity Use-case

#### Informing Biological Plausibility

- Are there data showing PFOA-associated disruption of early events in the process leading to the antibody response?
- Were changes at same or lower concentrations as the observed effect?
- **Examples:** Key cell populations, cell signaling, activation

Animal

Mechanistic Data

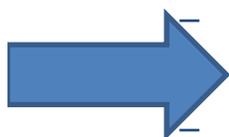

# Mechanistic Data from Use-case

- **Mechanistic Data**

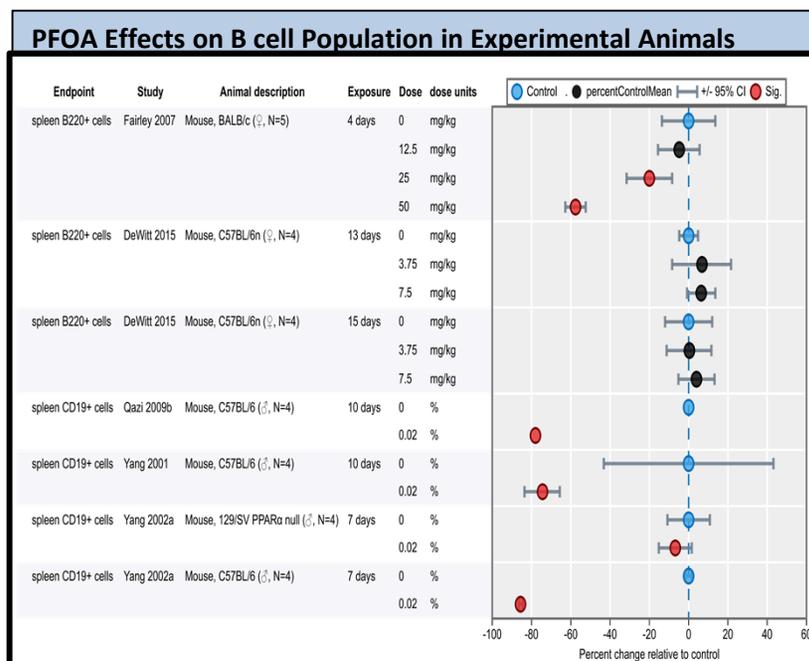

- B cell and T cell numbers
- Cytokines (IL-4, IL-6, IL-5)
- Antigen presenting cells

- **Evaluate Evidence**

- Magnitude
- Dose-response
- Consistency
- Publication Bias
- External Validity/  
Applicability
  - Endpoint for Humans
  - Dose

**Internal Validity/ Risk of Bias**

# Mechanistic Data from Use-case

- **Mechanistic Data**

- B cell and T cell numbers
- Cytokines (IL-4, IL-6, IL-5)
- Antigen presenting cells

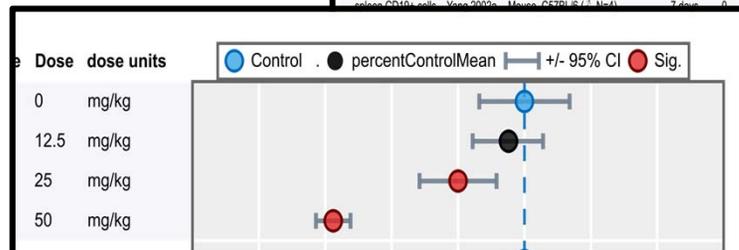

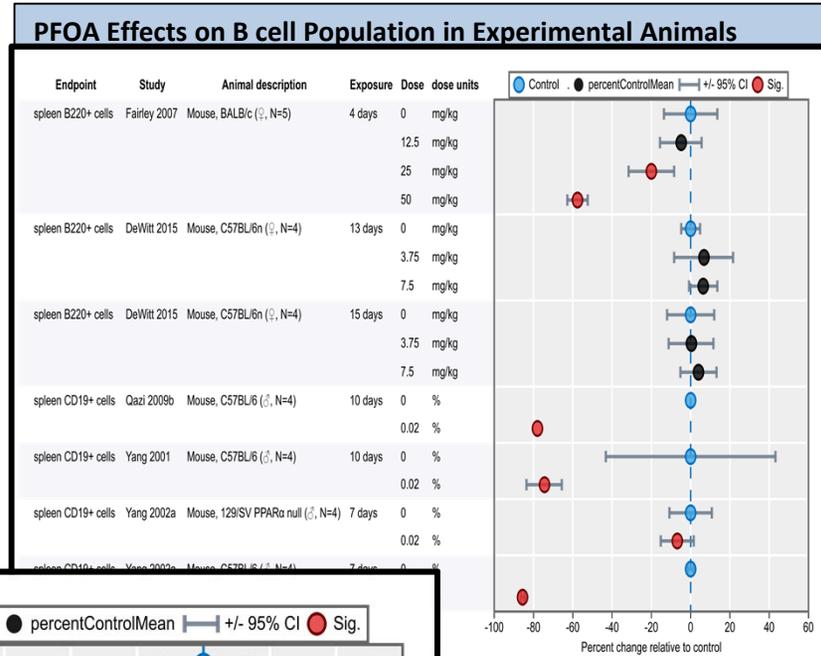

- **Evaluate Evidence**

- Magnitude
- Dose-response
- Consistency
- Internal Validity/ Risk of Bias
- Publication Bias

**External Validity/  
Applicability**

- **Endpoint for Humans**
- **Dose**

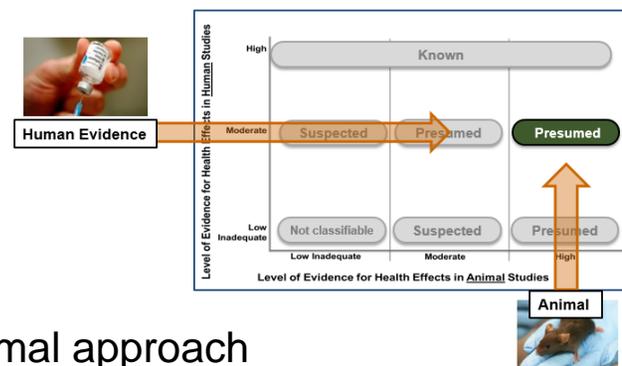

*the effective dose for mechanistic studies is **higher** than dose associated with effects in animal studies*

## Lessons from Use-Case

### Consideration of Mechanistic Data

- Problem Formulation
  - Outlined use of mechanistic data
  - Followed human and animal evidence (iterative)
- Internal Validity
  - Assessed with risk of bias method extended from animal approach
  - Focused on endpoints with relevance to human and animal data
- External Validity
  - Critical to have plan for evaluating key mechanistic data
  - Dose and applicability were drivers in use of mechanistic data
- Use-case Represents An Approach
  - Active area of research
  - Systematic review of current practices...

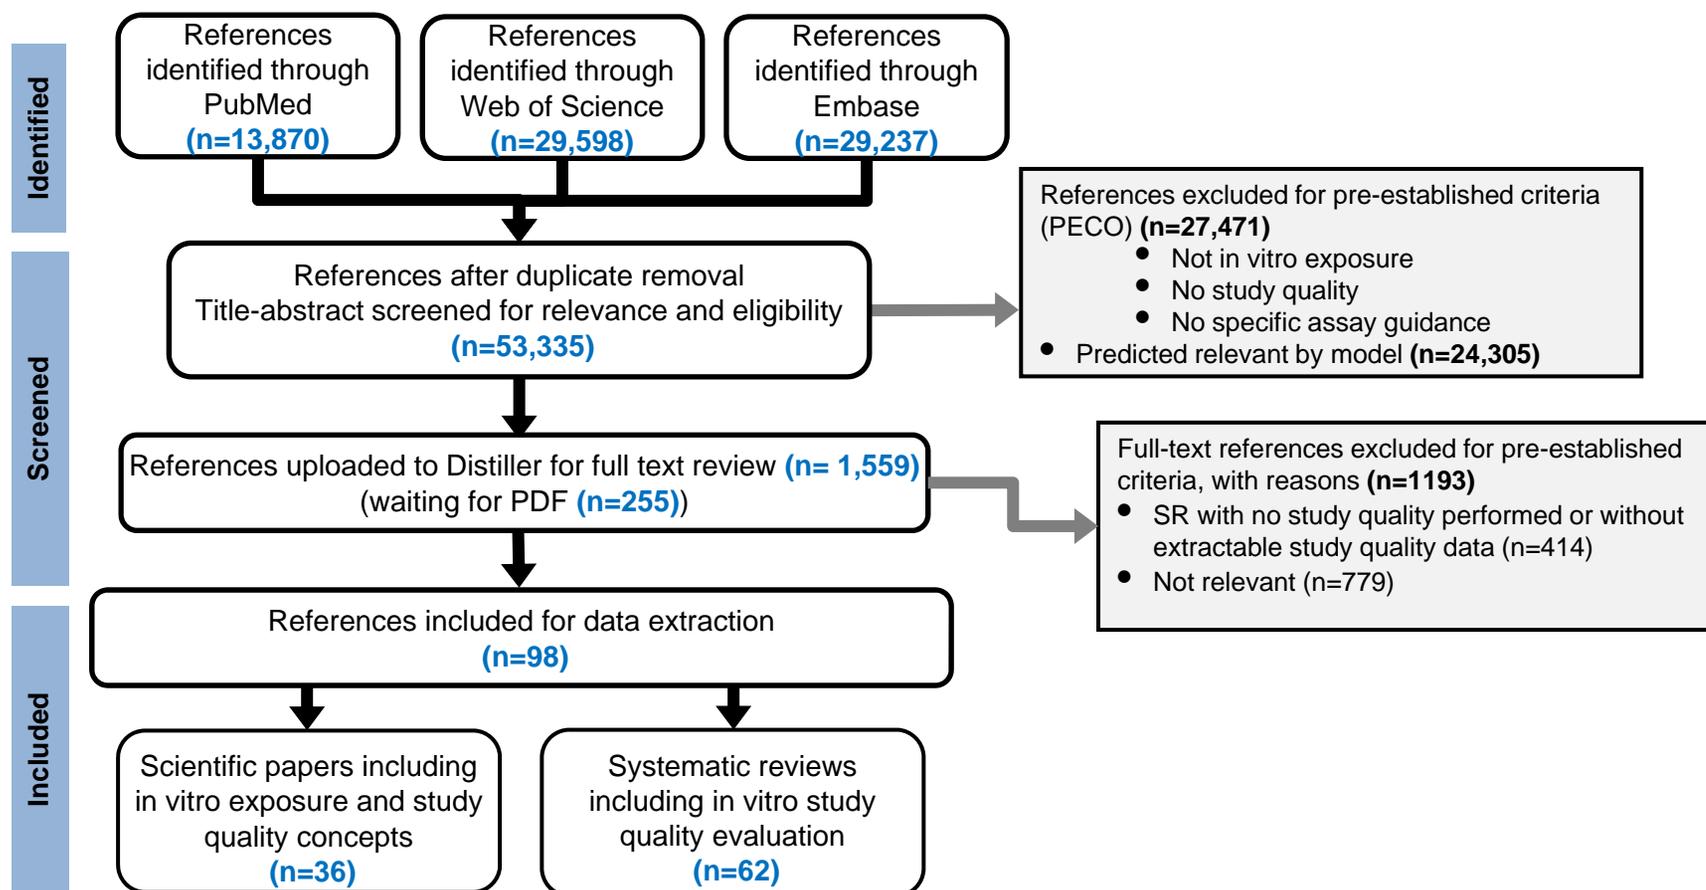

## Someone Needs to Do a Systematic Review...

---

- Systematic Review of Study Quality/Critical Appraisal Approaches Used to Assess In Vitro Studies
- NTP and Evidence-Based Toxicology Collaboration (EBTC) Effort
- Two Types of Published Studies
  - 1) Systematic reviews that considered and critically assessed in vitro studies
  - 2) Research papers, guidance, methods that provide guidance on how to critically assess in studies with an in vitro exposure regime

# Initial Systematic Review Screening

### Full Text Screening

- **Included**

- Research Papers/Methods
  - 36 publications
- Systematic Reviews
  - 62 SRs addressed in vitro exposure /study quality

- **Excluded**

- Reviews
  - 200 general “reviews”
  - 177 stated “systematic reviews” without apparent study quality evaluation
- In Process .... still pulling PDFs (255)

#### Systematic Review Topics

- Dentistry
- Medical/Clinical
- Nutrition
- Toxicology/  
Environmental Health
- General mechanisms

#### Research Paper Topics

- High-throughput screening
- Medical/Clinical
- Toxicology/  
Environmental Health
- General mechanisms

## Full Text Screening

- **Included**
  - Research Papers/Methods
    - 36 publications
  - Systematic Reviews
    - 62 SRs addressed in vitro exposures
- **Excluded**
  - Reviews
    - 200 general “reviews”
    - 177 stated “systematic reviews” without apparent study quality evaluation
- In Process .... still pulling PDFs (255)

## Developing Interactive Database

| Study Quality Characterization                             |   |                  |   |
|--|---|------------------|---|
| 'Domains'  | 'Questions'   | Short citat..    |   |
| Detection Bias   | Were experimental conditions similar across all groups? | Bonnaud, e..     | 1 |
|  |   | Stead, et al ..  | 2 |
|  | Can we be confident in the outcome assessment?          | Bouhifd, et ..   | 1 |
|  |   | Harbell, et ..   | 1 |
|  |   | Vesterinen,..    | 1 |
|  | Was there sufficient power to detect an effect?         | Lovell, et al .. | 1 |
|  |   | Mayhew, et..     | 1 |
|  |   | Valcu, et al ..  | 1 |
| Vesterinen,..  |   | 1                |   |
| Were there sufficient replicates to determine variability? | Bouhifd, et ..  | 1                |   |
|  | Caraus, et a..  | 1                |   |
|  | Lovell, et al ..  | 1                |   |
|  | Malo, et al (..   | 1                |   |
|  | McConnell, ..   | 1                |   |
|  | Valcu, et al ..   | 1                |   |
| Exposure bias  | Can we be confident in the exposure assessment?         | Hsie, et al (..  | 1 |

Thank you
